guide to the marine bluegreen algae Harold Judson Humm, Susanne R. Wicks. By: Humm, Harold Judson.
Contributors: Wicks, Susanne R.

Red algae gain their often brilliant colors due to the pigment phycoerythrin. This alga can live at greater depths than brown and green algae because it absorbs blue light. Coralline algae, a subgroup of red algae, is important in the formation of coral reefs . Several types of red algae are used in food additives, and some are regular parts of Asian cuisine. Example of red algae include Irish moss, coralline algae and dulse (*Palmaria palmata*). Continue Reading Below. Green Algae: Chlorophyta. Graham Eaton / Getty Images. More than 4,000 species of green algae exist on the planet. Green alga... Blue-green algae or cyanobacteria occur in an enormous diversity of habitats, freshwater and marine, as plankton (free floating), mats and periphyton (attached to surfaces). Hot spring mats of some *Oscillatoria* develop up to temperatures of 62°C (Figure 22.7). They have many beneficial functions such as nitrogen fixation and cycling of nutrients in the food chain. The offending bacteria may also grow in the sediment. These blooms can impart an off-taste and odor to the water, and/or result in the production of toxins. Figure 22.8. Cyanobacterial bloom.
