Originally, it was written for commercial growers, county extension agents, consultants, field and nursery staff, and chemical industry representatives. In recent years we have added sections that are useful to Master Gardeners and homeowners. More about the PNW Insect Management Handbook.

Civilization has battled pests throughout history. Of the many examples of how pests have impacted human society, one of the most infamous is the Black Plague in Europe in the fourteenth century, when millions of people—approximately one-third of Europe's population at that time—died from a mysterious disease. At the time, the disease was believed to be the result of God's displeasure with humanity or the result of other supernatural powers or heavenly disturbances. Late blight continues to be a major pest of potatoes, but this plant disease is managed through the use of resistant potato cultivars, proper sanitation practices, and fungicides. Even today, late blight is one of the major pathogens that chemical companies target in their search for new fungicides.
